                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
        Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Score

PT Human adrenomedullin peptide(s), PO70, PO71, PO72 and PAMP-20 - used in PT the diagnosis and treatment of type II diabetes and cancer.

S Claim 1; Page 43; 106pp; English.

Human adrenomedullin (AM) peptides PO70, PO71, PO72 and PAMP-20 were used tor the production of anti-AM antibodies (Ab). PO70 represents preproAM

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC amino acids (aa) 34-41 with the sequence Tyr-Tyr attached at the N-CC terminus, PO71 represents preproAM as 122-131 with the sequence Tyr-Gly-CC Gly attached at the N-terminus, PO72 represents preproAM as 116-146 and CC PAWP-20 represents the proAM N-terminus. The Ab are useful for the CC prevention and/or treatment of cancers by inhibiting cell growth. They care also useful for regulating that in secretion and blood glucose compared to the diagnosis or treatment of conditions relating to They may be used for the diagnosis or treatment of conditions relating to CC pregnancy e.g. precelampsia. The Ab are also useful for the following: CC (i) regulating neurotransmission or neuron growth in areas of the central nervous system; (ii) lessening or inhibiting mast cell degranulation and CC nervous system; (ii) lessening or inhibiting mast cell degranulation and CC nervous system; (ii) lessening or inhibiting mast cell degranulation and CC nervous system; (ii) lessening or inhibiting mast cell degranulation and CC nervous system; (ii) lessening or inhibiting mast cell degranulation and CC nervous system; (ii) lessening or inhibiting mast cell degranulation and CC nervous system; (iii) lessening or inhibiting or treat infection; (iv) conditions results betterial and fungal growth (to treat infection); (iv)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel albumin fusion protein having albumin or biological activity. Human serum albumin is responsible for a significant proportion of the osmotic pressure of serum and also functions as a carrier of endogenous and exogenous ligands. The fusion of albumin to a therapeutic protein may increase shelf-life and stability of the therapeutic protein. The albumin fusion protein of the invention may allow production of compositions with antidiabetic activity whilst the nucleotide sequence which encodes it may be useful for gene therapy. The albumin fusion protein is useful for preparing a composition for treating diabetes mellitus. The present sequence is that of a therapeutic protein which was fused with human albumin to create a novel albumin fusion protein of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obstained in electronic format directly from WIPO at ftp.wipo.int/pub/publishedpct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cerebroprotective; vasotropic; anticonvulsant; antiparkinsonian; haemostatic; hypertensive; muscular-Gen; ophthalmological;

CC levels in the neural tissue, which is administered where (A) induces neurogenesis. The invention may be useful for the CC production of compounds with a noctropic, neuroprotective, CNS-Gen, CC cerebroprotective, vasotropic, anticonvulsant, antiparkinsonian.

CC haemostatic, hypertensive, muscular-Gen, ophthalmological, cartifical mmatory, analgesic or antidiabbetic activity. These compounds may compound to the neurogenesis modulators, neural stem or progenitor cell grotein coupled receptor activators, neurogenesis inducers, circular neural cAMP enhancers, intracellular neural tissue compounds may compound to the neurogenesis in neurogenesis in neural cartification is cuseful for modulating neurogenesis in neural tissue of a patient cartification of disease and Parkinson's disorders, Huntington's disease, alleting neurogenesis and expressive supranuclear palsy, tewy body disease, alleting cartification deprinting and spinal cord injury, cancer-related brain and spinal cord injury, multi-infarct dementia and geriatric dementia; for increasing the intracellular neural tissue of or stimulation, migration or survival of neurogenesis. The agent modulates of neurogenesis in neural tissue by modulating proliferation.

CC ells in the tissue; by maintaining or increasing the intracellular levels of or stimulation, migration or survival of neural stem cells or progenitor cells in the tissue, the neural stem cells in the neural tissue relative to a patient not dosed with the agent or by activation of a G-protein of campiled receptor in the neural tissue of the meural cand objury or disease by endogenous of the neural stem cells by over 20% compared to untreated tissue. The individual of neurogenesis allows treatment of cells into a survival of neurogenesis allows treatment of cells into a survival of neurogenesis allows treatment of tissue. The neurogenesis allows treatment of the neurogenesis into a survival o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              agent

Human adrenomedullin (AM) peptides PO70, PO71, PO72 and PAMP-20 were use for the production of anti-AM antibodies (Ab). PO70 represents preproAM amino acids (aa) 34-41 with the sequence Tyr-Tyr attached at the N-terminus, PO71 represents preproAM as 122-131 with the sequence Tyr-Gly-Gly attached at the N-terminus, PO72 represents preproAM as 116-146 and PAMP-20 represents the proAM N-terminus. The Ab are useful for the prevention and/or treatment of cancers, e.g. adrenal, nervous system, lung, colon, ovarian and breast cancer by inhibiting cell growth. They

and PAMP-20 were used

The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidy) and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half crife) and specificity as bonding to large molecules decreases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

They may be used for the diagnosis or treatment of conditions relating to pregnancy e.g. preeclampsia. The Ab are also useful for the following:

(i) regulating neurotransmission or neuron growth in areas of the central nervous system; (ii) lessening or inhibiting mast cell degranulation and hence reducing the effects of an allergic response; (iii) inhibiting or preventing bacterial and fungal growth (to treat infection); (iv) faccilitating wound healing; and (v) promoting organ and bone development

                                                                                                The invention relates to antagonists of the vasoactive peptide calcitonin gene related peptide (CGRP) and other members of the CGRP superfamily. The invention also relates to amino the terminal modifications of peptides to improve their ability to bind to a member of the CGRP receptor super-family. CGRP antagonists are used for inhibiting CGRP activity which can be used in vitro e.g. in assays to identify and/or isolate CGRP receptors or with intact cells either in vitro or in vivo to inhibit the effect of CGRP binding to its receptor. The present sequence
                                                                                                                                                                                                                         Vasoactive peptides useful for inhibiting calcitonin gene related receptor activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     intracellular uptake and interference with physiological processes. neurogenesis of agent(s) that elevate intracellular cyclic adenosine monophosphate intracellular calcium levels in neural tissue for modulating to treat central nervous system disorder.

Disclosure; SEQ ID NO 17; 77pp; English.

CC This invention relates to a novel method of modulating neurogenesis in CC the neural tissue of a patient exhibiting symptom(s) of a central nervous CC system disorder, such as neurodegenerative, ischaemic or learning and CC memory disorder or neurological trauma. The method involves at least one CC (cAMP) levels or at least one agent (B) that elevates intracellular cyclic adenosine monophosphate CC (cAMP) levels or at least one agent (B) that elevates intracellular Ca 2+ CC levels in the neural tissue, which is administered where (A) modulates CC and (B) induces neurogenesis. The invention may be useful for the production of compounds with a nootropic, neuroprotective, CNS-Gen, CC cerebroprotective, vasotropic, anticonvulsant, antiparkinsonian.

CC deam inflammatory, analgesic or antidiabetic activity. These compounds may act as neurogenesis modulators, neural stem or progenitor cell proliferation, differentiation and/or migration modulators, neural tissue CC intracellular neural cAMP enhancers, intracellular neural cAMP enhancers, intracellular neural cAMP enhancers, intracellular neural cAMP enhancers intracellular neural cAMP enhancers intracellular neural cAMP enhancers, intracellular neural cAMP enhancers

The agent modulates (c) differentiation, migration or survival of neural stem cells or progenitor cells in the tissue; by maintaining or increasing the amount or cells in the tissue; by maintaining or increasing the amount or procedulates (c) percentage of doublecortin positive cells in the neural tissue relative cells in the neural stem cells or protein compared to untreated the processor. The in vivo induction of neurogenesis allows treatment of cempladers caused by cell loss, injury or disease by rendogenous creplacement and obviates the need for transplanting foreign cells into a gatient. Neurogenesis can also be induced by administration of the neurogenesis can also be induced by administration avoids unnecessary systemic administration and possible side effects and further component it is never to the use of drugs and the controversial use of clarge quantities of embryonic tissue for treatment of parking has been shown to have the ability to increase intracellular cAMP levels and which is related to the method of the inversion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Matches

                                                                                                                                 The present invention describes a modified therapeutic peptide (I) CC comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidyl and maleimido groups) attached to CC a less therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity in CC vivo for the treatment of various disorders. Endogenous therapeutic CC uptides are not suitable as drug candidates as they require frequent CC deptides are not suitable as drug candidates as they require frequent CC modifying and attaching therapeutic peptides to albumin prevents or CC reduces the action of peptidases to increase length of activity (half CC life) and specificity as bonding to large molecules decreases CC intracellular uptake and interference with physiological processes. CC AAB90829 to AAB92441 represent peptides which can be used in the CC exemplification of the present invention

Vasoactive peptides useful for inhibiting calcitonin gene related peptide receptor activity.

Claim 5; Col 25-26; 24pp; English

The invention relates to antagonists of the vasoactive peptide calcitonin gene related peptide (CGRP) and other members of the CGRP superfamily. The invention also relates to amino the terminal modifications of peptides to improve their ability to bind to a member of the CGRP-receptor super-family. CGRP antagonists are used for inhibiting CGRP activity which can be used in vitro e.g. in assays to identify and/or isolate CGRP receptors or with intact cells either in vitro or in vivo to receptors or with

                 AAB91765 standard; peptide; 52 AA.
                                                                                                                              Sequence
                                                                                                                                            The invention relates to a new modified vasoactive peptide. The vasoactive peptides are useful in inhibiting calcitonin gene related vasoactive peptides are useful in inhibiting calcitonin gene related peptide CGRP binding to one or more receptors, identifying CGRP antagonists, and identifying a CGRP receptor in a cell. The peptides are also useful in treating migraine, diabetes, sepsis, inflammation, cardiac disorders, and acts as a potent vasodilator. The present sequence represents the amino acid sequence of an adrenomedullin protein.
                                                                                                                                                                                                                                                                    WPI; 2003-874533/81.

comprising a therapeutically active amino acid region (III) and a creactive group (III) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptide composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half life) and specificity as bonding to large molecules decreases in the section of the periods of large molecules decreases. AAB90829 to AAB92441 represent peptides which can be used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                  The present invention describes a modified therapeutic peptide (I) comprising a therapeutically active amino acid region (III) and a reactive group (II) (e.g. succinimidyl and maleimido groups) attached to a less therapeutically active amino acid region (IV), which covalently bonds with amino/hydroxyl/thiol groups on blood components to form a peptidase stabilised therapeutic peptides composed of 3-50 amino acids. (I) are useful for modifying therapeutic peptides e.g. hormones, growth factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent administration due to rapid degradation by peptidases in the body. Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half intracellular uptake and interference with physiological processes. Alagous to Alagous to Alagous the perseent peptides which can be used in the

The method comprises: (a) producing the fused protein using a recombinant host cell; (b) restricted digestion of the fused protein by a protease followed by collection of sediment; and (c) dissolving the sediment and extracting adrenomedullin precursor. The method can be used for the production of adrenomedullin precursor for pharmaceutical and diagnostic applications. CC The invention relates to antagonists of the vasoactive peptide calcitonin CC gene related peptide (CGRP) and other members of the CGRP superfamily. CC The invention also relates to amino the terminal modifications of CC peptides to improve their ability to bind to a member of the CGRP-CC receptor super-family. CGRP antagonists are used for inhibiting CGRP-CC activity which can be used in vitro e.g. in assays to identify and/or CC isolate CGRP receptors or with intact cells either in vitro or in vivo to CC inhibit the effect of CGRP binding to its receptor. The present sequence XX Squence 52 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score

  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score
